(R-16) Anecdotal Case Study:

Admirals Cove Golf and Country Club, Jupiter, Florida v2

Observation From The Applicator of a High-Maintenance Golf Development

By: Rick Anderson,
President of Aquatic Balance
2-20-16

Bio-Zyme has been used for lake management on the golf course lakes at Admirals Golf and Country Club in Jupiter, Florida. The two golf courses and surrounding development have approximately 40 acres of waterways within. These are older lakes with a much sediment buildup and heavy nutrient loading. The golf course and lakes are within a very high-end property. The lakes on the golf course have high visibility and aesthetics is a critical component of this account. The demand for better looking lakes required something different. We started using the Bio-Zyme five years ago.

Typical treatments were with copper sulfate and chelated copper algaecides, two to three visits per month. Our traditional algae treatments of copper, Diquat and Hydrothol 191 had become less and less effective.

Our customer is very happy to see a better, more natural solution to the nutrient problem they have been experiencing. We both have witnessed increased clarity and the elimination of smelly organic sediment on the lake bottom. We have also witnessed a large increase in snails and freshwater clams.

We feel the Bio-Zyme treatments are much better for the ecosystem and our lakes appear much cleaner, and clearer.
