## ***What is it?***

### **(WP-8) The Bio-Zyme Bio-Generator System (v2)**

The bio-generator or incubation station is designed to incubate beneficial, naturally occurring bacteria and enzymes for treating the lakes. We apply this product to the waterbody for improved water quality, to help manage excess nutrient and for the reduction of sludge buildup on the bottom.

## ***Why?***

Many older lakes contain large amounts of bottom sediment, which contains nitrogen and phosphorus that feed large algae blooms. This detritus mostly organic in composition feeds the growth of filamentous algae and single celled planktonic algae. The Bio-Zyme organisms will compete with the algae for their food source (the nutrients) in the sludge. The enzymes will also breakdown unavailable, or tied up nutrients in the soils for consumption by other organisms.

This is a TRM Biologics, self- contained Bio-Zyme Bio-Generator System.
